Distribution functions

$$P(a) = \frac{1}{Z} \int d\mathbf{R} \delta(a(\mathbf{R}) - a) = \langle \delta(a(\mathbf{R}) - a) \rangle$$

```
CALL read_trajectory( R )
READ *, grid_min, grid_max, grid_width
ngrid=int((grid_max-grid_min)/grid_width)+1
ALLOCATE(P(ngrid))
DO isteps=1,nsteps
    CALL compute_a( R , a)
    igrd=int( (a-grid_min)/grid_width) + 1
    P(igrd)=P(igrd)+1.0
END DO
int=0.0
DO igrd=1,ngrid
    int=int+P(igrd)*grid_width
END DO
P(1:ngrid)=P(1:ngrid)/int
CALL print_P(P)
```

Root Mean Square Displacement or RMSD

$$\text{RMSD} = \sqrt{\frac{1}{N} \sum_I^N \delta_I^2}$$
$$\delta_I = |\mathbf{R}_I - \mathbf{R}_I^{\text{ref}}|$$

RMSD

high
RMSD

MD
time

Mean Square Displacement

$$\langle \Delta r^2 \rangle = \frac{1}{N} \sum_I^N \Delta \mathbf{R}_I(t)^2$$

distance travelled by atom I in
time t

$$\frac{\partial \langle \Delta r^2 \rangle}{\partial t} = 2dD$$

Connection to diffusion coefficient

Dynamic Properties: Correlation Functions

$$C_{AA}(t) = \langle a(0)a(t) \rangle = \int dx f(x) a(x) a(x_t(x))$$

distribution

dynamic
property

For short time, x_t and x are not very different \Rightarrow highly correlated

For long time, x_t and x could be highly uncorrelated due to non-linear forces

\Rightarrow trajectory loses memory

Correlation time: time upto which the properties remains correlated

Correlation length depends on the nature of the system

$$C_{AA}(t) = \langle a(t_0)a(t_0 + t) \rangle = \lim_{\tau \rightarrow \infty} \frac{1}{\tau} \int_0^\tau dt_0 a(t_0)a(t_0 + t)$$

autocorrelation

shift time origin from $\tau=0$ to some time τ and average over all these different time origin

$$C_{AB}(t) = \langle a(t_0)b(t_0 + t) \rangle$$

cross-correlation

Normalized correlation:

$$C_{AB}(t) = \frac{\langle a(t_0)b(t_0 + t) \rangle}{\langle a(t_0)b(t_0) \rangle}$$

solid

periodic forces

intermediate
decorrelation
that decays
gradually

liquid

decorrelates
quickly

gas

Implementation:

$$C_{AB}(t) = \frac{1}{t_{\max}} \sum_{t_0}^{t_{\max}} a(t_0) b(t_0 + t)$$

Computing diffusion coefficient:

$$D = \int_0^{\infty} dt C(t)$$

diffusion coefficient

$$C(t) = \frac{1}{3N} \left\langle \sum_I^N \mathbf{v}_I(t_0) \cdot \mathbf{v}_I(t_0 + t) \right\rangle$$

Fourier Transform of Velocity autocorrelation

$$G(\omega) = \int_{-\infty}^{\infty} dt C(t) \exp(-2\pi i \omega t)$$

Discrete Fourier Transform:

$$G_k = \sum_{j=0}^{N-1} C_j \exp(-i 2\pi j k / N)$$

for N
points

FT of dipole-Dipole autocorrelation can be compared to IR spectrum (intensity as well)

FT of velocity autocorrelation can be compared with vibrational spectrum (not intensity but peak positions)

$G(\omega)$ is called vibrational density of states (if velocities are majorly contributed by the vibrational motion): area under the curve is proportional to the number of degrees of freedom contributing to that vibrational mode

Home work set 3 a)

Write a program for computing velocity autocorrelation function.

Write a program to convert velocity autocorrelation function to power spectrum.

Test the above for a simple harmonic oscillator in NVE ensemble.

Test the above for a simple harmonic oscillator connected with Langevin thermostat in NVT ensemble.
